& stay healthy forever?

Prevention is the KEY.

Early detection of disease is important. However disease prevention is more critical in ensuring a healthy dog. Vaccination is one of the preventive care you can provide to your pet.

There is a list of deadly infectious diseases which can be easily prevented by vaccination.

Canine Adenovirus Type 2

Infected dog will have infectious tracheobronchitis (inflammation of the upper airways) and pneumonia.

Canine Parainfluenza 2

Infected dog displays flu-like symptoms like fever, nasal discharges. One of the causative agent of kennel cough

Leptospirosis

A dangerous bacterial disease, which can infect human, results in kidney and liver damage. Symptoms are oral ulceration, jaundice.

Canine Distemper

A fatal viral disease. Infected dog will have diarrhea and vomiting, eye and nasal discharge, skin problem and seizures. Neurological damage is often permanent.

Canine Parvovirus

A very contagious disease which is transmitted through ingestion of viral-contaminated feces. Symptoms are usually severe diarrhea and vomiting. Mortality is highest in 2-6months old unvaccinated puppies.

Canine Coronavirus

This virus causes intestinal damage to your dogs. Mortality can be as high as 90% when your dog is concurrently infected with parvovirus.

Canine infectitious Hepatitis

Symptoms are anorexia, thirst, eye and nose discharges, abdominal pain and vomiting. Corneal opacity develops in some recovered dogs.

Attention !

- For effective protection, each puppy should receive **at least 3 vaccines** starting from 6 weeks old.
- **Yearly booster** is important to stimulate the memory cells of immune system for continuous and effective protection to your dog and also prevent disease transmission to other dogs.
- Vaccination is a **professional medical procedure** and should only be done by a licensed veterinarian after thorough physical examination is performed.
